ENVIRONMENTAL CONSULTING

To correct severe salinity damage to the grass and soil at Green Mubazzarah Park, Al Alain (UAE), Taurus Environmental Consulting, LLC has undertaken treatments with biofertilizers and amino acids under the supervision of municipal technicians and the Royal Garden contractor responsible for the area's maintenance. The results have been astonishing and quick.

Naturcare's microorganisms have intensely degraded the saline compounds, resulting in the clear disappearance of the saltpeter surface layer and a lighter green color on small grass clumps that had survived the extreme conditions. This is the first step in allowing the deep roots of the dry grass to begin to react. This is an astonishing and quick grass recovery from severe damage caused by a prolonged stress situation (high saline levels over 5,000 ppm, 49 °C temperature, prolonged water stress, and lack of nutrients).
