

The Technical Cooperation Programme between Taurus Envrionmental Consulting, LLC and the Omani Ministry of Agriculture & Livestock successfully conducted tomato crop trials at a selected Al Batiman Farm from October 2017 to January 2018. The trials aimed to identify and mitigate biotic and abiotic stressors, and to enhance yield in tube growing units. Implementing the recommended treatments at the farm resulted in remarkably high uniformity and quality of tomato production, **a one-month reduction in harvesting time**, and an extension of the collection period, increasing the yield from 8 kg (before) to **27 kg per square meter**.
